

AI debate

We have debated about the topic of Artificial Intelligence (AI). my part was why is AI is dangerous to human beings. we discuss AI in a guest lecture also.

Here are some points from the part of my debate:

- Job displacement: Automation and AI may eliminate jobs and increase economic inequality.
- Bias and discrimination: Biases existing in its training data may be amplified and perpetuated by the AI system, producing unfair and discriminating results.
- Privacy and discrimination: Large volumes of sensitive personal data may be processed and stored by AI systems, which raises the risk of data breaches and other security concerns.
- Lack of transparency: understanding AI systems may be challenging, and this system's outputs and decision-making process can be hazed, making it challenging to spot and correct any potential biases or mistakes.
- Autonomy: AS AI systems become more autonomous, they may make judgments that are at odds with human morality or ideals, which might have negative effects and cause harm.
- Societal impact: if AI is not controlled or governed by ethical norms, it may have a detrimental influence on society and result in increasing inequality, loss of privacy, and other issues
- Autonomous transportation and drones: the increased use of autonomous vehicles and drones powered by AI can lead to increased carbon emissions and air pollution.
- Data centers: A large number of data centers required to support AI applications can consume a significant amount of energy and contribute to carbon emissions.
- Predictive analytics: AI-based predictive analytics, such as weather forecasting, can help to understand and mitigate environmental risks, but if not used responsibly, can lead to mismanagement of resources and other negative consequences.

Although AI helped human beings by easing our day-to-day life if there are good things there are also some consciences that human beings should handle. It is like two sides of one coin.

Thank you
